

Integrating the driver experience

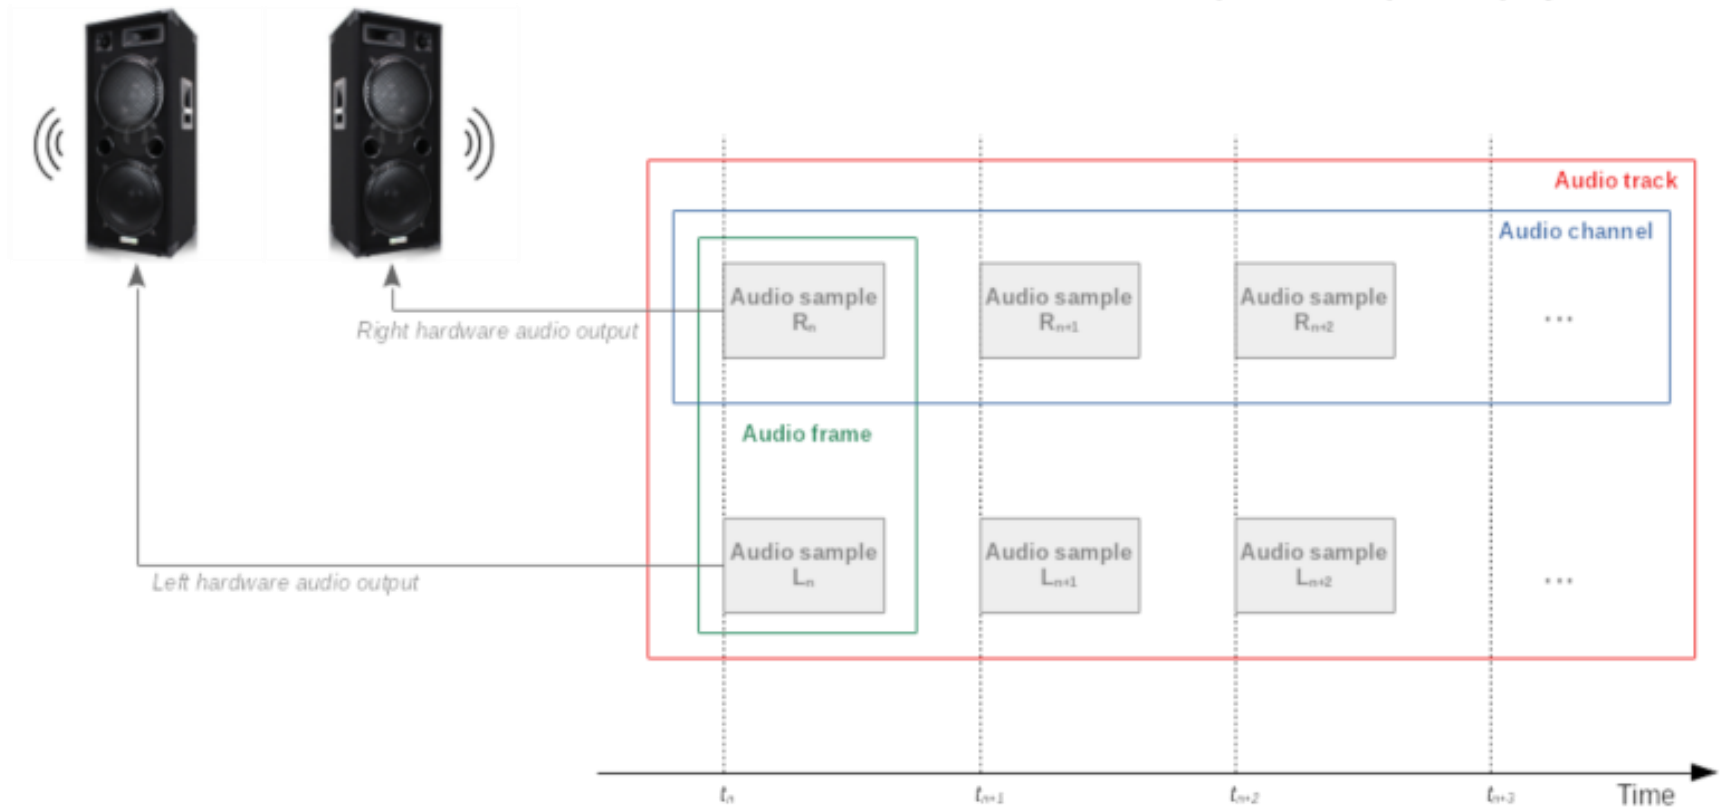

VIRTIO audio
Genivi AMM Munich 2019

public

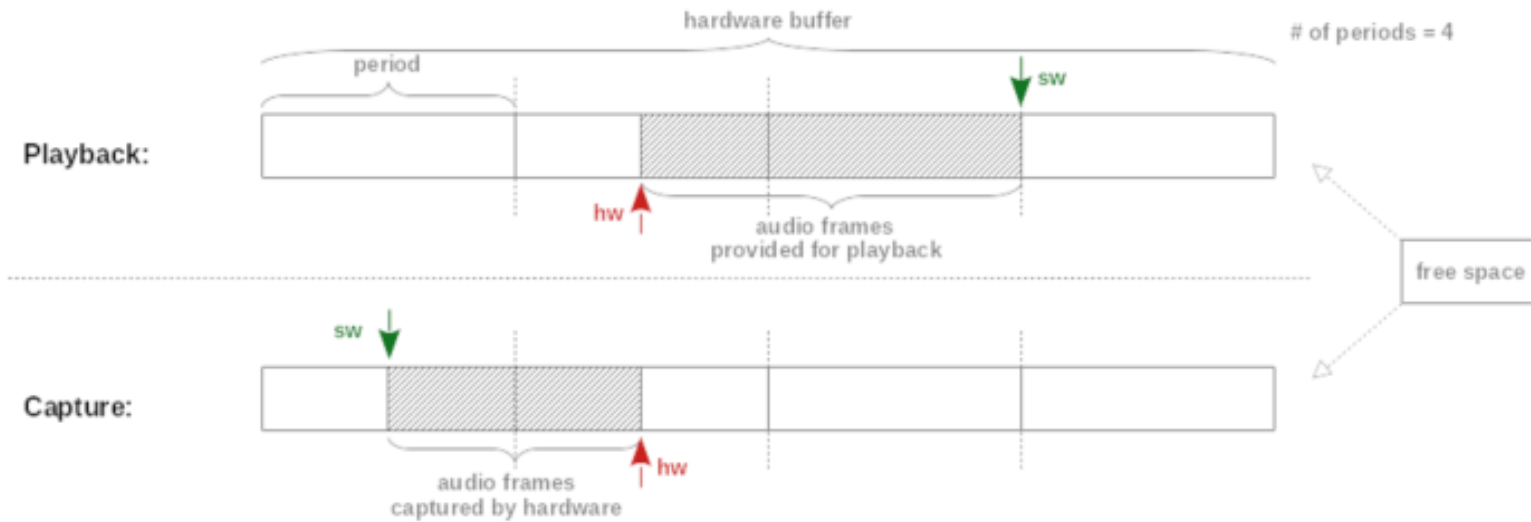

- **Allow virtual machines to access audio streams**
 - playback stream for sound reproduction
 - capture stream for sound capturing
 -
- **Challenges**
 - Don't stop
 - Don't interrupt
 - Low latency
 - Short stream startup time
 - Enable hardware offloading

Audio Buffer basics

Visualization of stereo (2-channels) audio playback

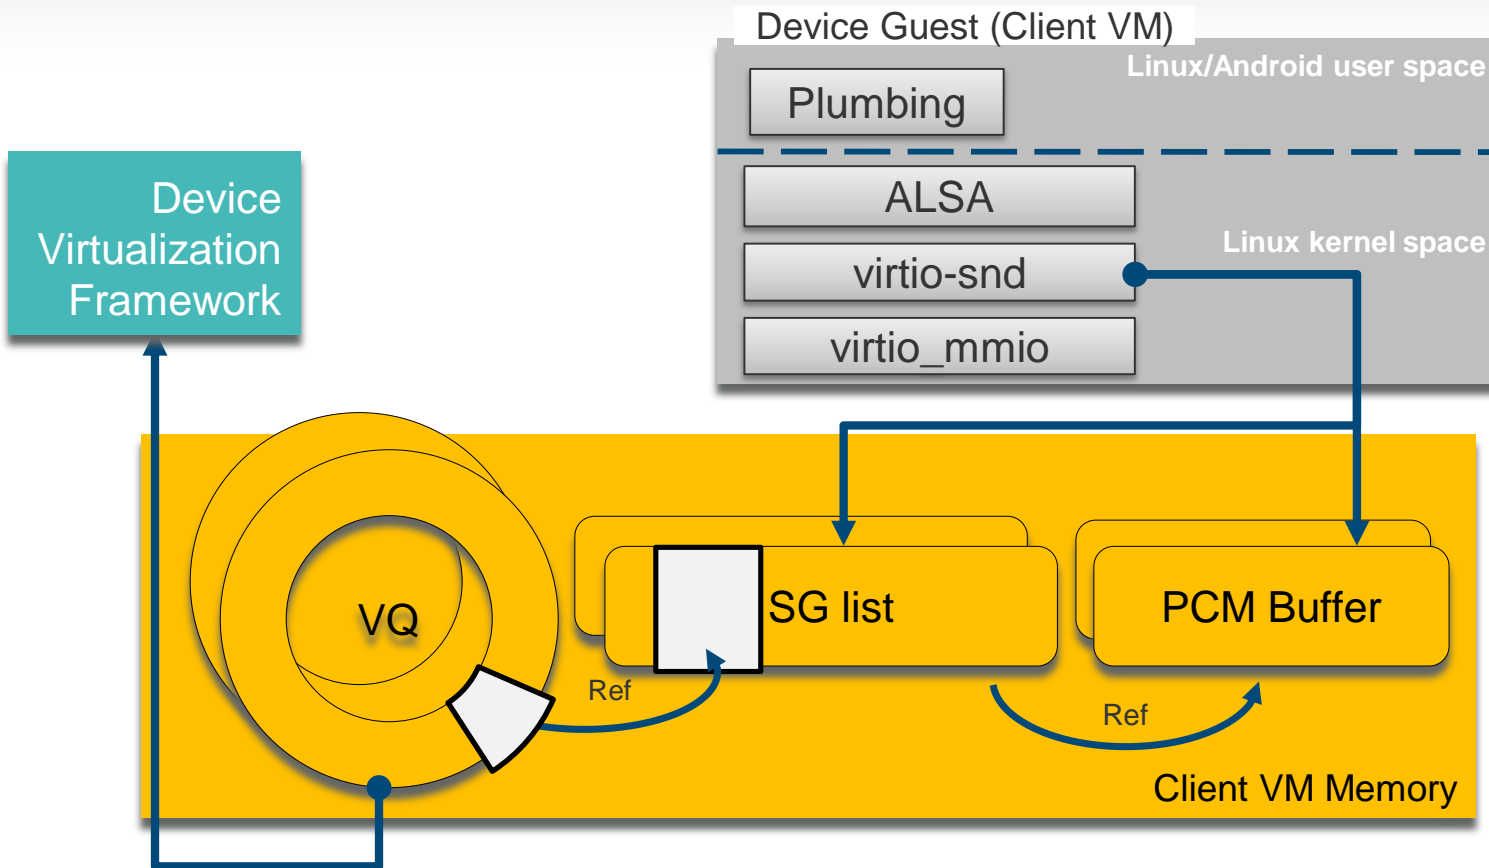

Audio Buffer basics

Visualization of in memory layout for stereo (2-channels) audio frames

Virtualized device Architecture with VIRTIO

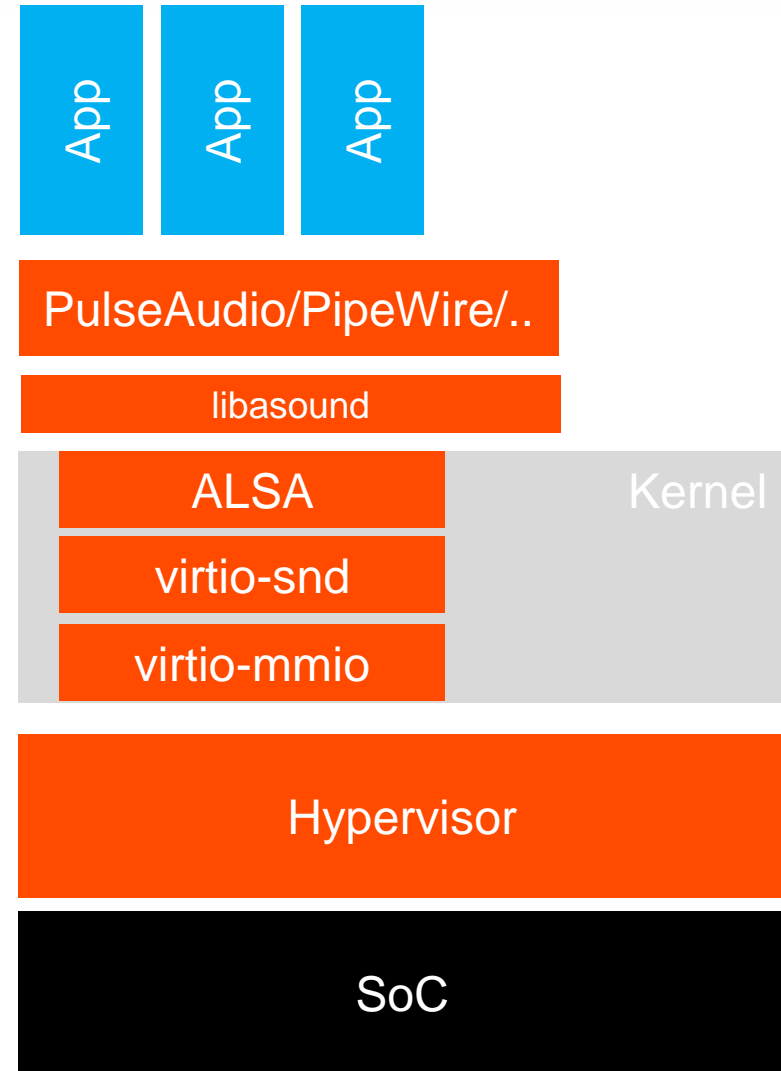

One queue for control (channel discovery, capabilities, etc)

One queue per channel, input and output are interleaved

- One channel is the set of coherent streams
- If multiple incoherent streams are needed, add more devices

VQ=virt-queue
SG=Scatter Gather

- **Implements also driver model**
 - Highly flexible
 - Dynamic probing to make hardware capabilities available in the guest

- **Spec currently on virtio-level mailinglist**
 - Discussions still ongoing
- **PoC is running**
 - With COQOS hypervisor running Linux on rcar
 - QEMU-ARM running Android
 - QEMU-KVM running Linux
 - QEMU-KVM running Windows 10
- **Linux kernel driver RFC patchset will be posted shortly**
- **QEMU reference implementation to follow**
