Agenda

- Overview DLT
- MultiNode DLT
- What's next?

Overview DLT

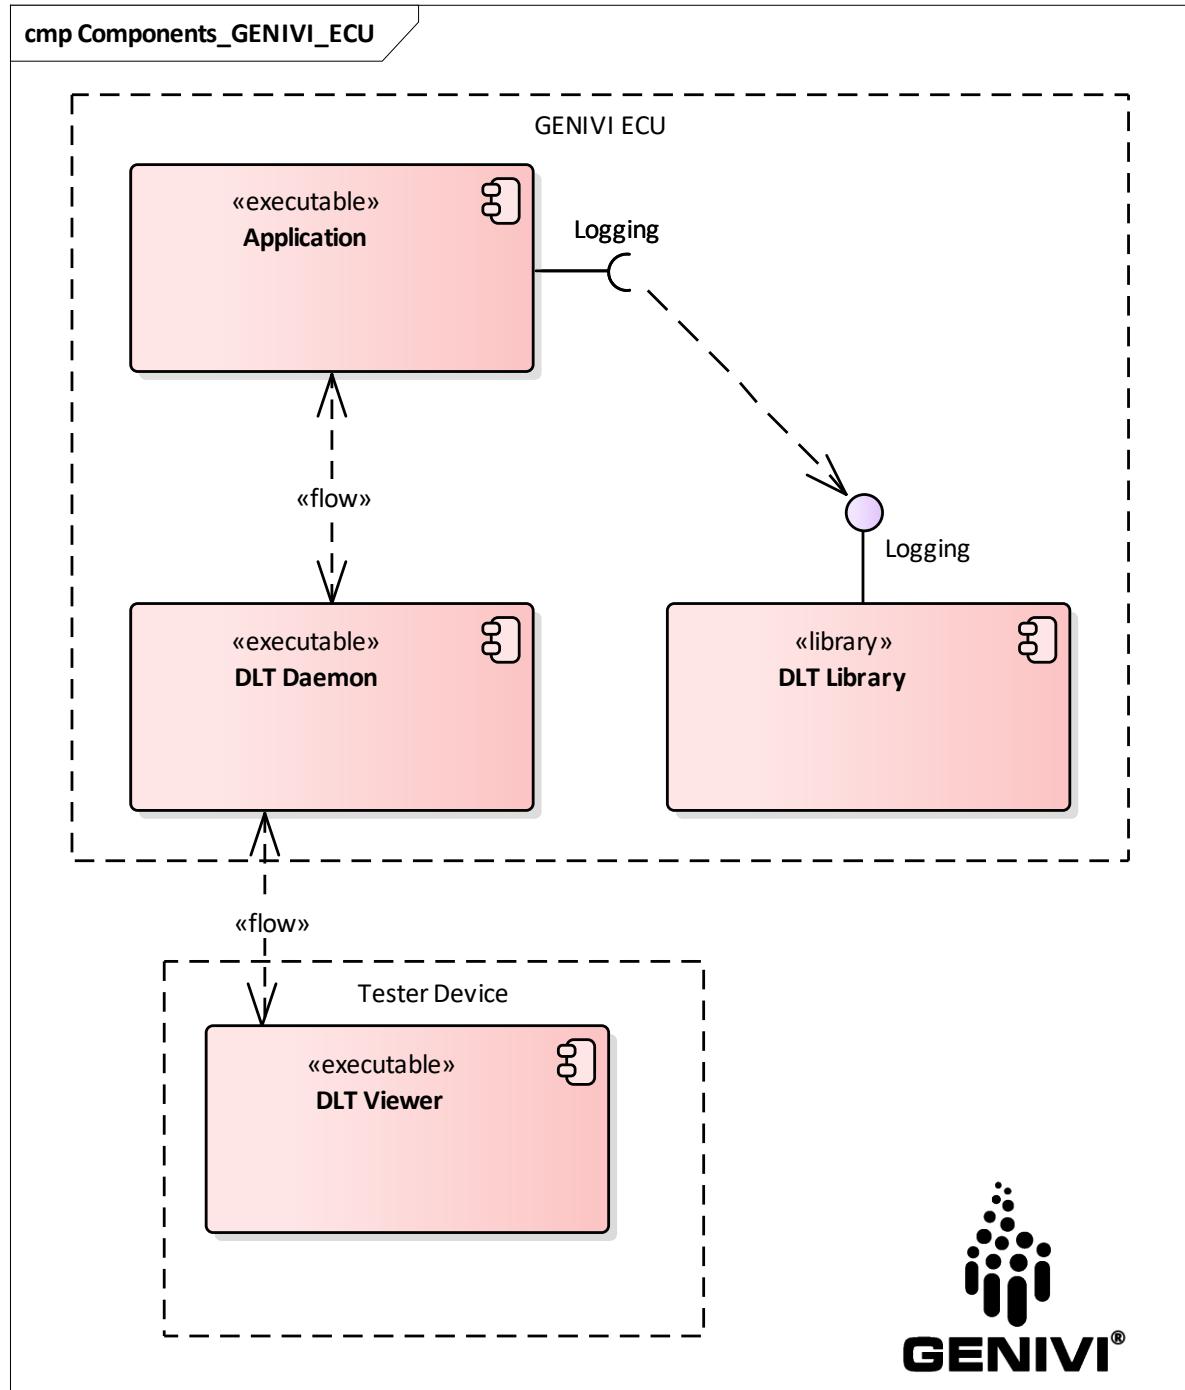

DLT Overview

- Diagnostic Log and Trace
 - component for logging and tracing in ECUs in AUTOSAR 4.0
 - Provides standardized interface for logging and data format for transferring to host
 - Goals
 - Validation during development
 - Analysis of the end product
 - Standardization
 - Information and code
 - <https://github.com/GENIVI/dlt-daemon>
- DLT Viewer
 - ready to use host tool to view logs and to control the DLT Daemon and applications
 - Information and code
 - <https://github.com/GENIVI/dlt-viewer>

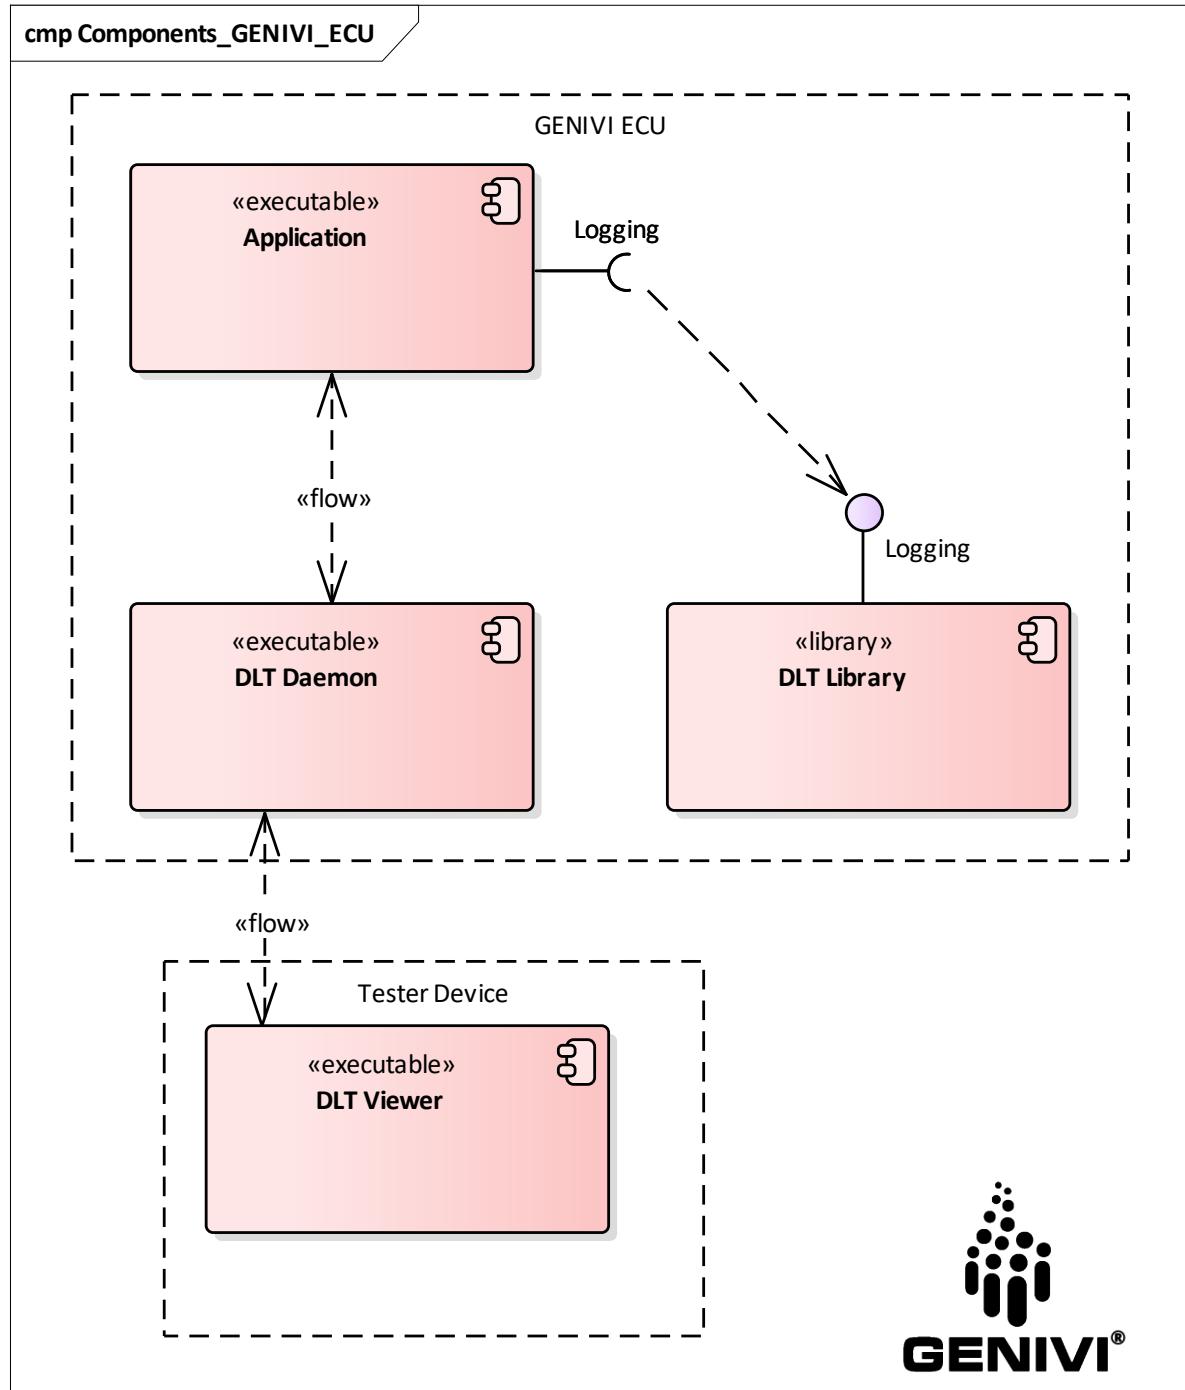

DLT Overview

- Supported Features
 - Support for multiple applications with multiple contexts organized in a hierarchy
 - Support for different interfaces between daemon and viewer (TCP/IP, Serial)
 - Verbose and Non-verbose mode logging
 - Predefined control messages
 - Message injection callback
 - User library and daemon provides a temporary internal buffer
 - Adapters to connect Linux log facilities like systemd-journal
 - MultiNode support
 - Offline Logging
 - etc.

DLT Overview

- Supported Features
 - Support for multiple applications with multiple contexts organized in a hierarchy
 - Support for different interfaces between daemon and viewer (TCP/IP, Serial)
 - Verbose and Non-verbose mode logging
 - Predefined control messages
 - Message injection callback
 - User library and daemon provides a temporary internal buffer
 - Adapters to connect Linux log facilities like systemd-journal
 - **MultiNode support**
 - Offline Logging
 - etc.

DLT Overview

- DLT Example Application

```
#include <dlt/dlt.h>

DLT_DECLARE_CONTEXT(ctx); /* declare context */

int main()
{
    DLT_REGISTER_APP("MAPP", "Test Application for Logging"); /* register application */

    DLT_REGISTER_CONTEXT(ctx, "TES1", "Test Context 1 for Logging"); /* register context */
    DLT_LOG(ctx, DLT_LOG_ERROR, DLT_INT(5), DLT_STRING("This is an error")); /* Write your logs */

    /* ... */

    DLT_UNREGISTER_CONTEXT(ctx); /* unregister your contexts */
    DLT_UNREGISTER_APP(); /* unregister your application */
    return 0;
}
```

DLT Overview

- DLT Example Application in DLT Viewer

Project				
Id		Description	LogLevel	TraceStatus
▼ ECU online		A new ECU [localhost:3490]	Default: info	Default: off
▼ MAPP		Test Application for Logging		
TES1		Test Context 1 for Logging	info	default

MultiNode DLT

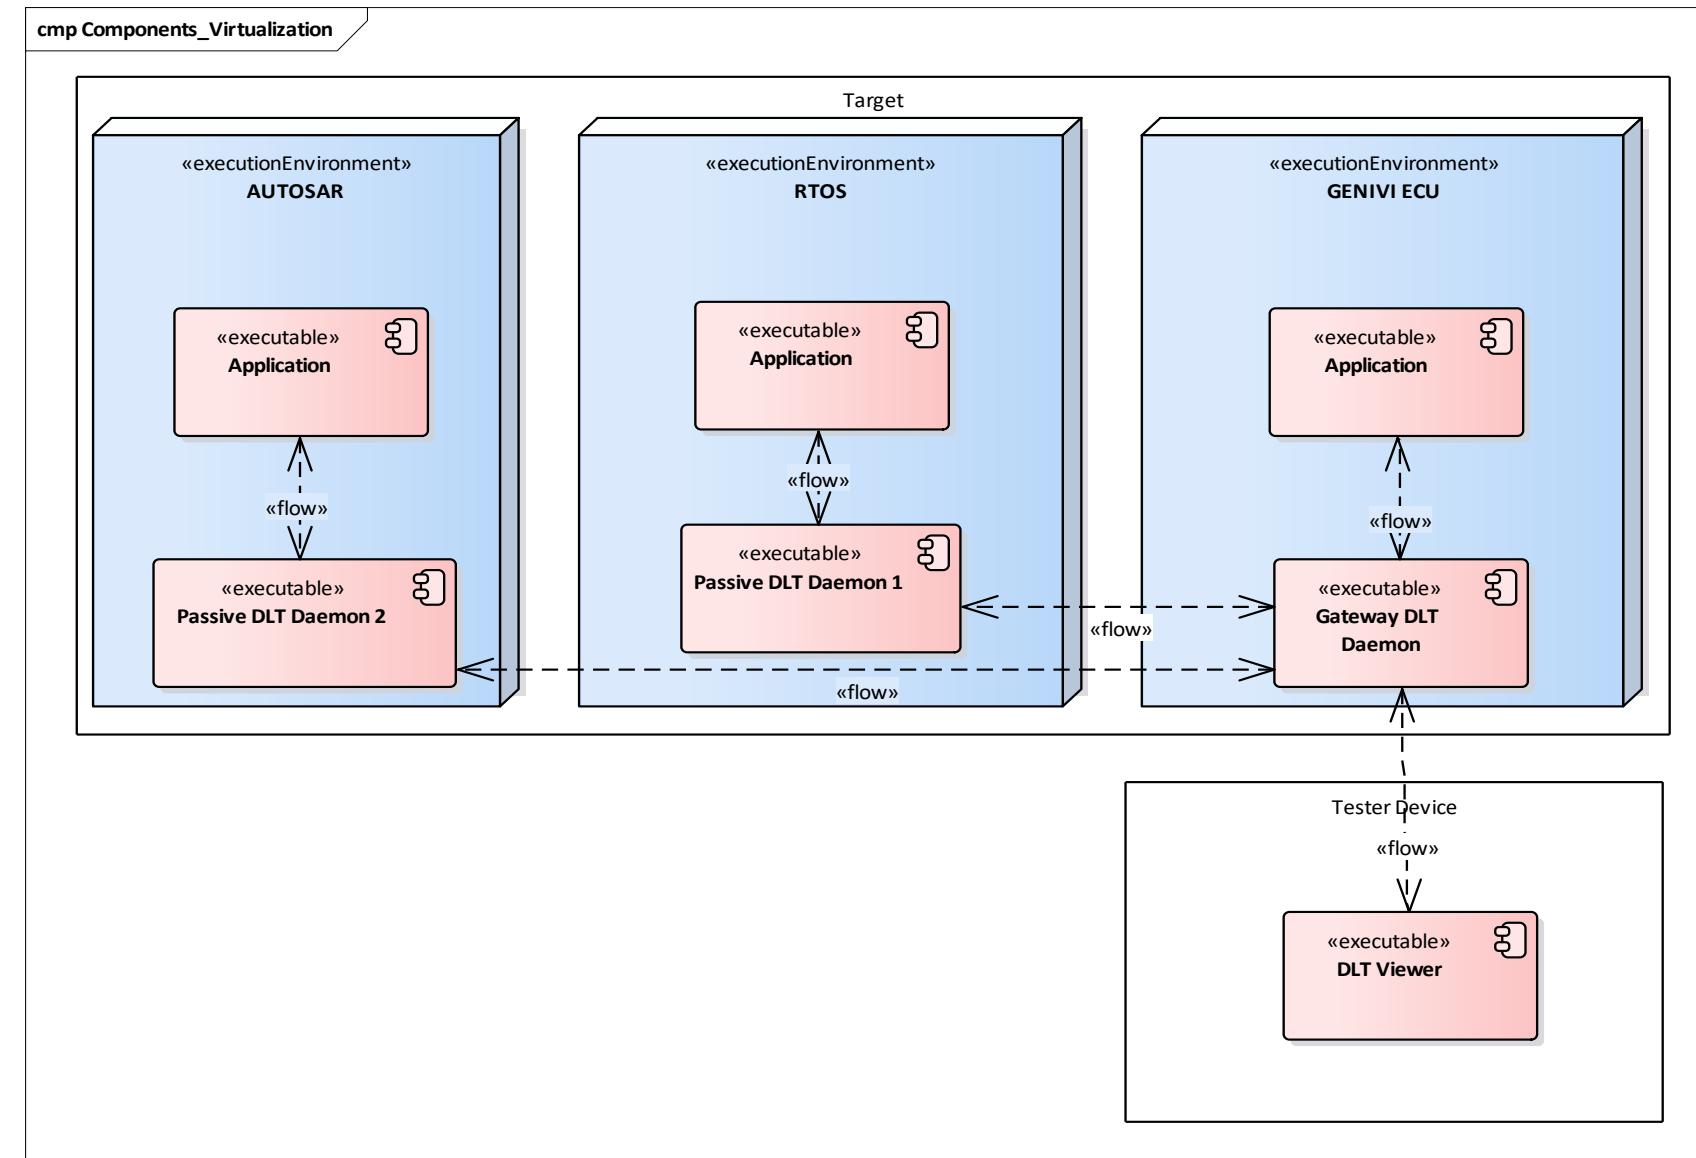

New Use Cases

- Container - 2 different scenarios
 1. Applications inside container shall directly log messages to Gateway DLT Daemon
 2. Another DLT Daemon runs inside the container without direct connection to the outside world
- Solution (1): Unix Sockets
 - Use Unix sockets instead of named pipes for communication
 - <https://github.com/GENIVI/dlt-daemon/pull/43>
- Solution (2): MultiNode configuration

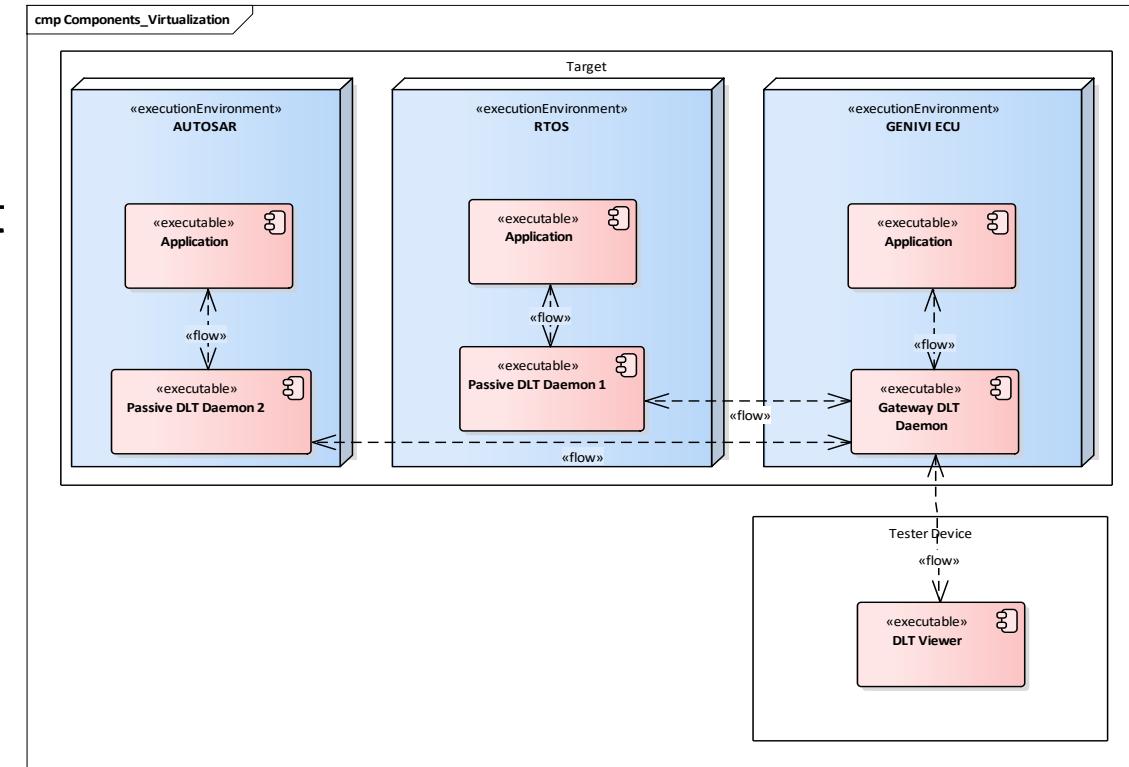

New Use Cases

- ECU consolidation
 - DLT is deployed into different OSes but only one single connection to the outside
- Solution: MultiNode configuration

DLT MultiNode - Summary

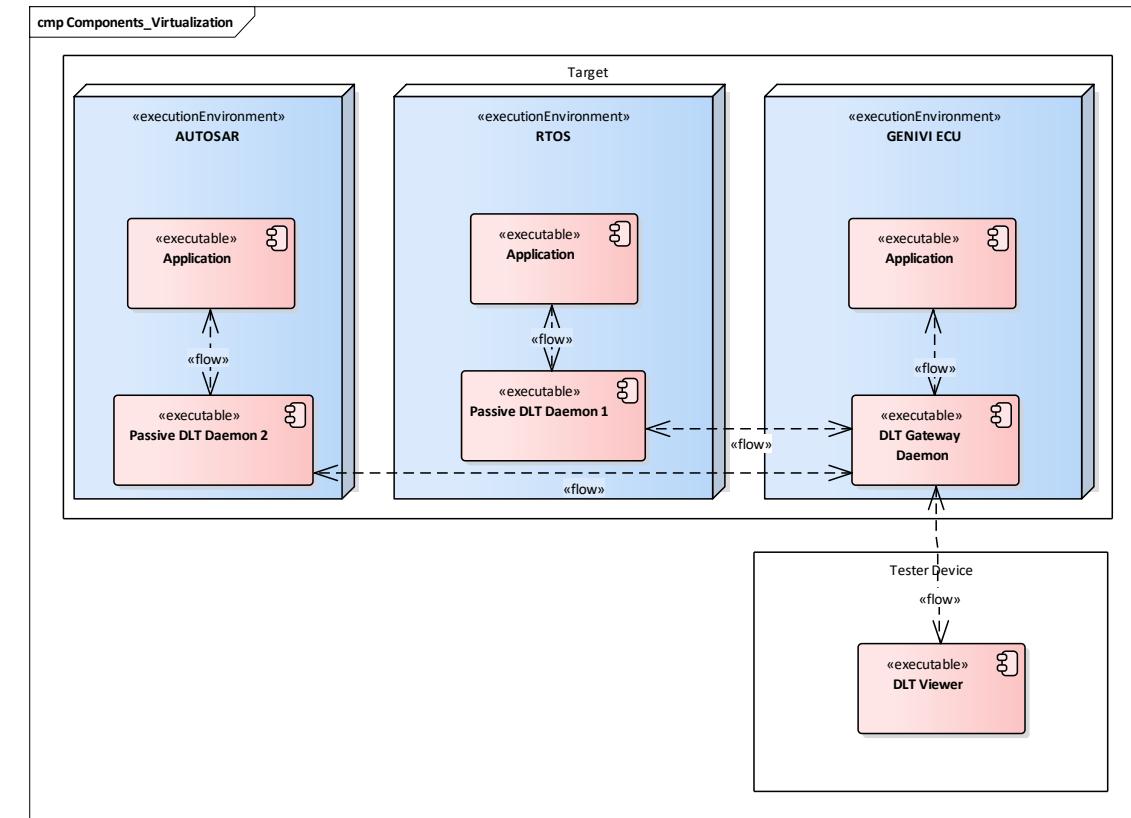

- Allows to connect DLT Daemons running in different execution environments
- Any DLT Client can only be connected to the Gateway DLT Daemon
- All other passive DLT Daemons don't need any physical connection to any DLT client
- All messages are routed through the Gateway DLT Daemon
 - From passive DLT Daemons to the DLT Client
 - Control messages from DLT Client to passive DLT Daemons
- Gateway DLT Daemon behaves like a DLT Client for passive DLT Daemons – therefore no change needed

DLT MultiNode - Configuration

- Precondition
 - Each DLT Daemon needs its own ECU Identifier
 - TCP connection between ECUs

```
# Set ECU ID (Default: ECU1)
ECUId = ECU1
```

DLT MultiNode - Configuration

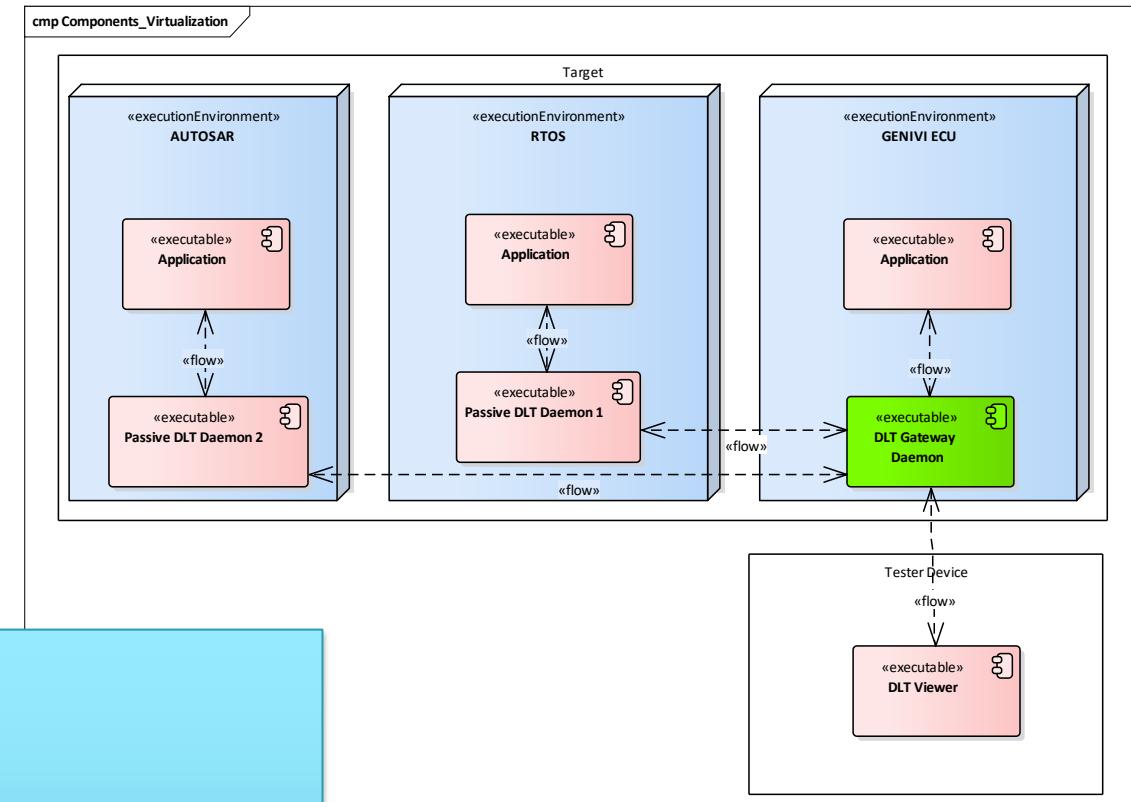

- Configuration
 - Enable Gateway mode in dlt.conf for the DLT Daemon that acts as gateway

```
# Enable Gateway mode (Default: 0)
GatewayMode = 1
```

- Gateway configuration file

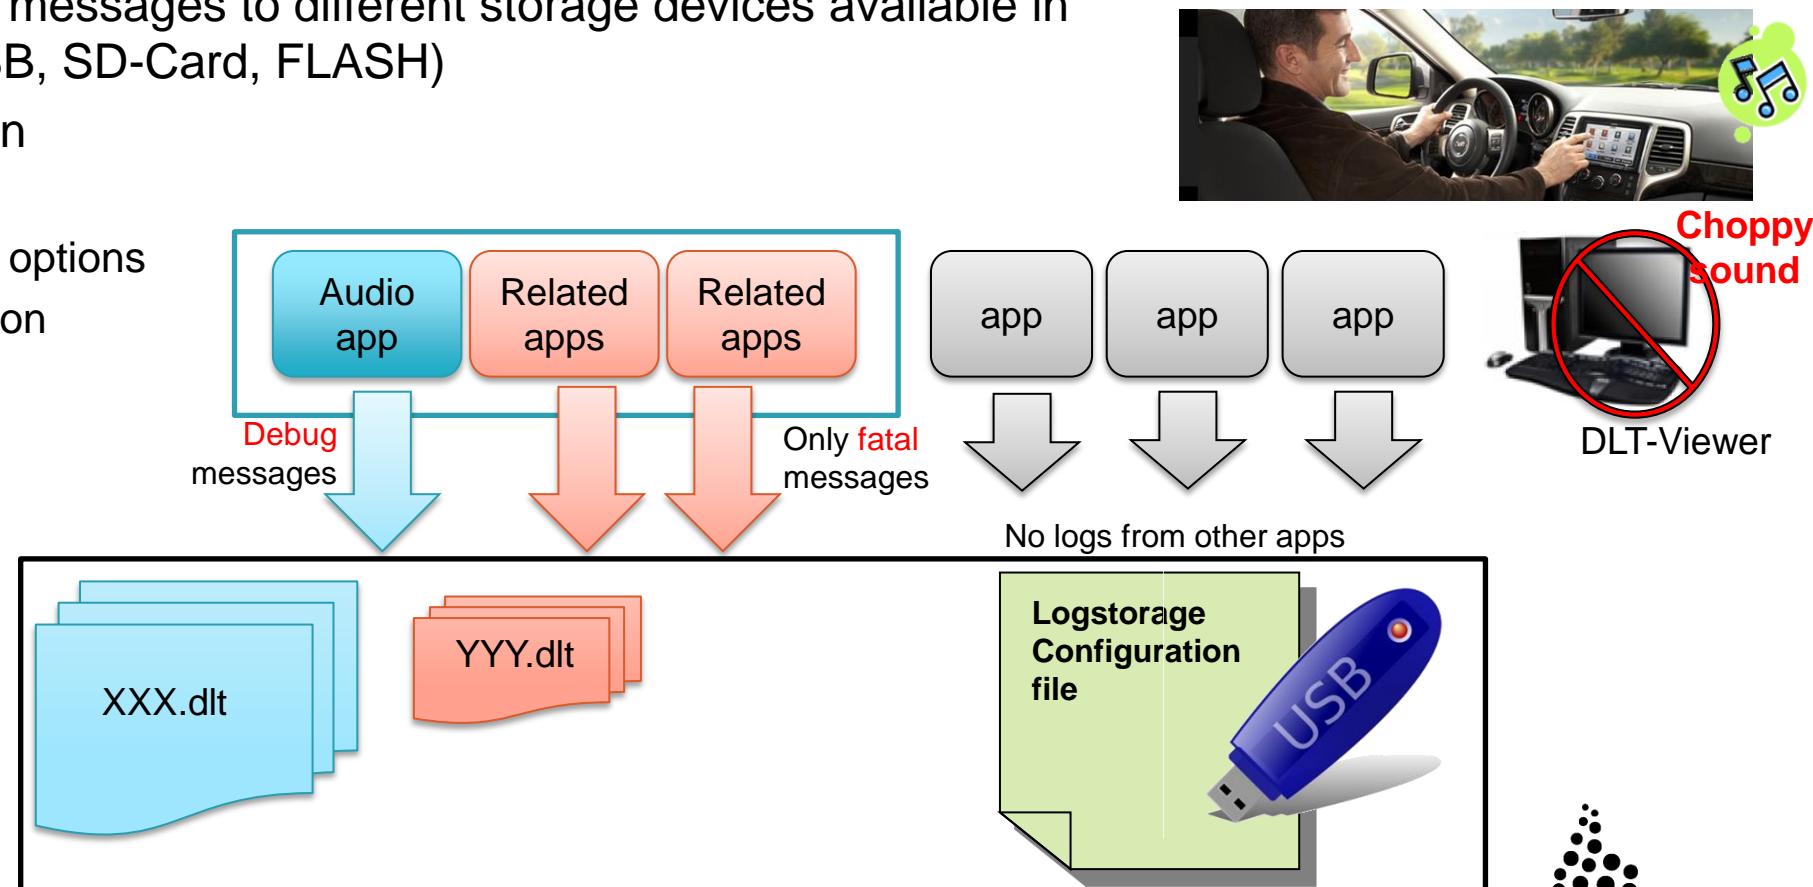

```
[PassiveNode1]

IPaddress=192.168.2.11
; TCP port. Default 3490 is used if no port is specified.
; Port=3490
; passive nodes ECU identifier. Mandatory.
EcuID=ECU2
; Try connect to passive Node on DLT Daemon startup. Default OnStartup if not specified.
; Connect=OnStartup
; Stop connecting to passive node, if not successful after 10 seconds
Timeout=10
; Send following control messages after connection is established
; SendControl=0x03,0x13
```

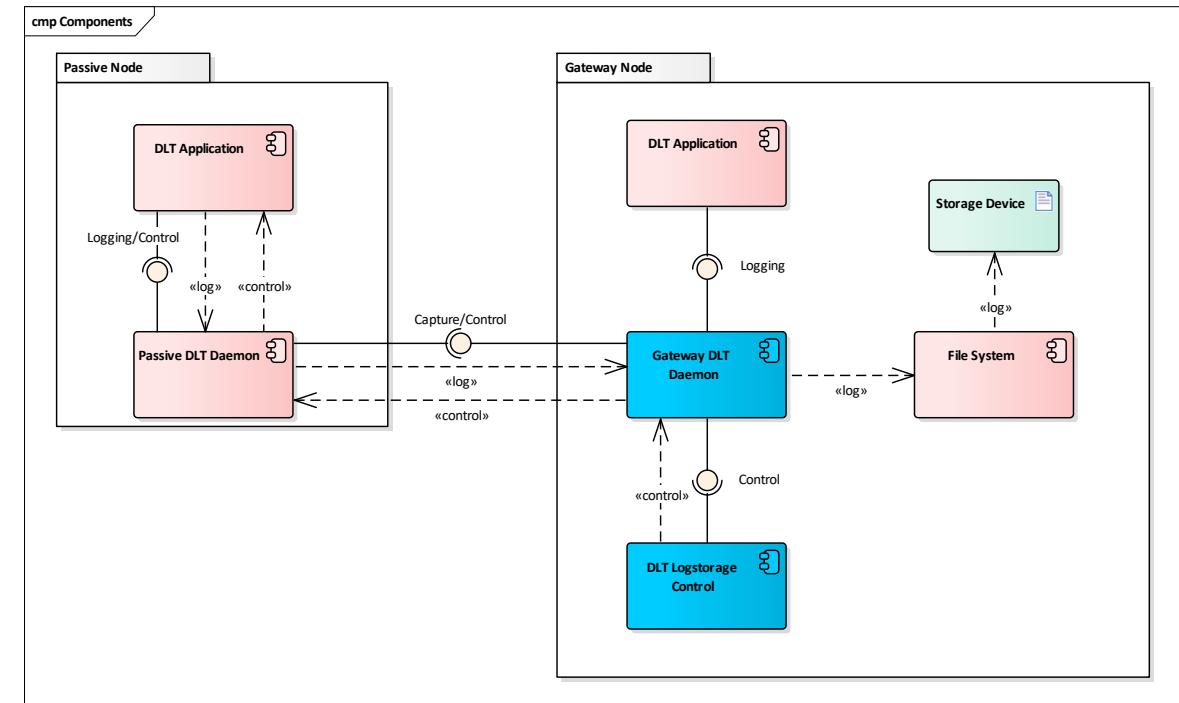

DLT MultiNode and Logstorage

- **Use case:** Collecting logs during test drives
- Supported features
 - Store application log messages to different storage devices available in the platform (e.g. USB, SD-Card, FLASH)
 - Runtime configuration
 - Start/Stop logging
 - Many configuration options per filter configuration

DLT MultiNode and Logstorage

- **Use case:** Collecting logs during test drives
- Supported features
 - Store application log messages to different storage devices available in the platform (e.g. USB, SD-Card, FLASH)
 - Runtime configuration
 - Start/Stop logging
 - Many configuration options per filter configuration

What's next?

What's next?

- DLT POSIX compliance... *first patches coming soon ...*
 - To run same DLT on other (RT)OS and easily deploy DLT MultiNode, some adaptions are needed
 - Refactor parts of the code to remove Linux specific system calls
 - High demand from users: <https://github.com/GENIVI/dlt-daemon/issues/52>

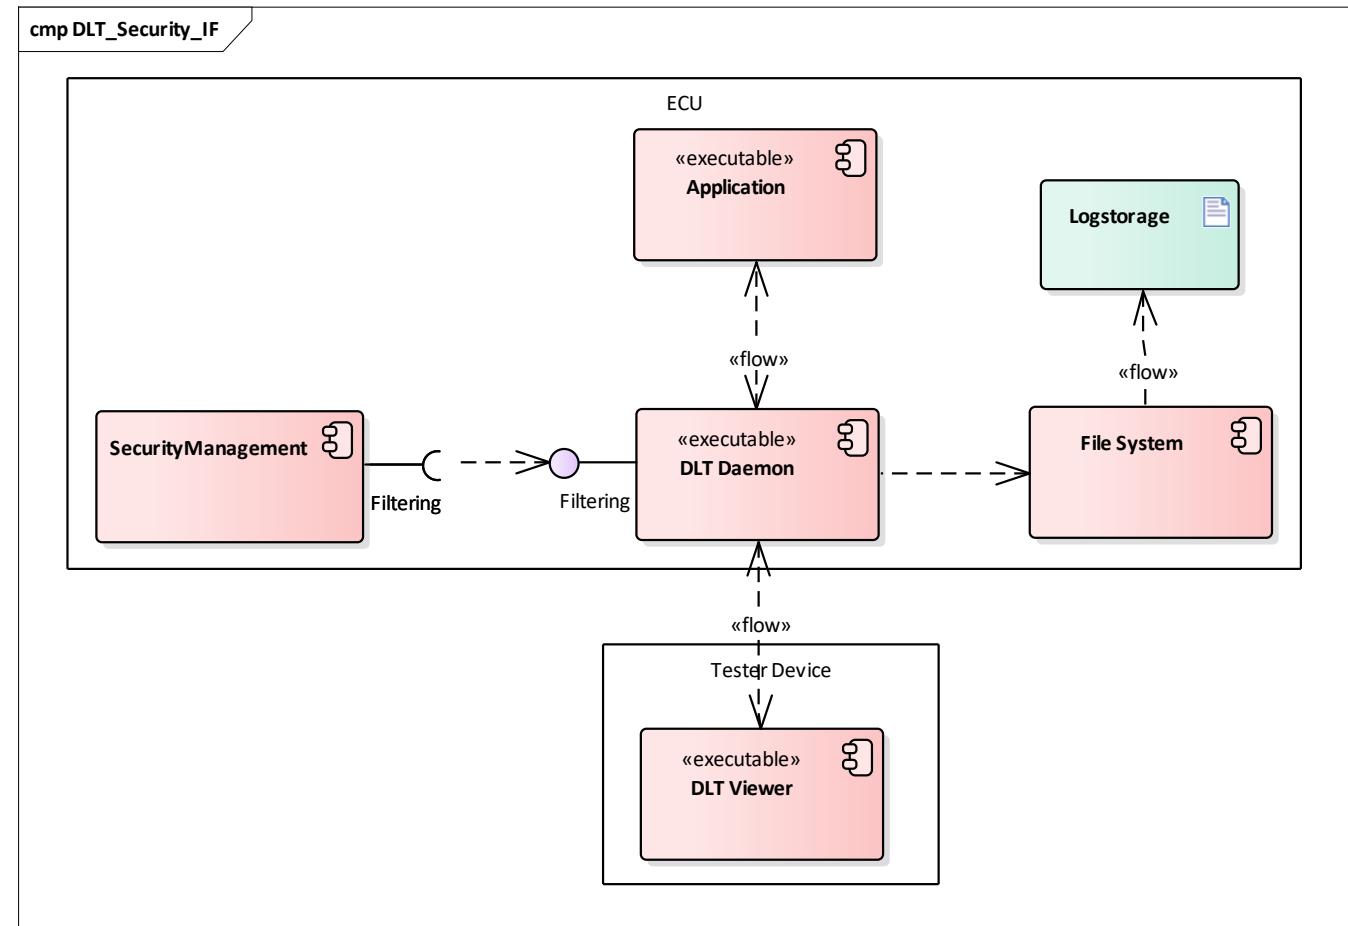

Compile with QNX #52

Open

What's next?

- DLT and Security
 - We need a way to configure a filter for logs and control messages based on state on the system
 - During development -> everything allowed
 - At the customer -> only certain logs of applications, no TCP connection
 - During service -> a certain set of applications will log to internal logstorage, only certain control messages
 - Ideas/Requirements/Contributions are welcome

What's next?

- Log consolidation
 - Not all execution environments use DLT logging (e.g. Android)
 - How to combine logs to get a (more) complete picture?
 - Ideas/Requirements/Contributions are welcome -> discussion point for SHDA project

Thank you!
