

ANNIVERSARY 2003-2023

COVESA and AUTOSAR Collaboration – Overview

Enabling Continuous Innovation

Michael Niklas-Höret, AUTOSAR Steering Committee April 25th 2023

COVESA All Members Meeting

Porto

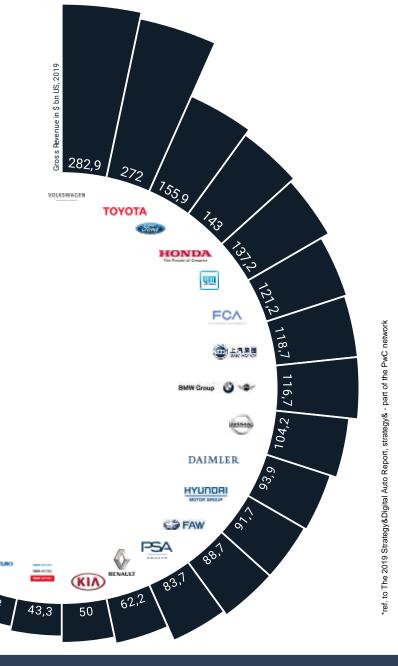

AUTOSAR Development Cooperation

A Global Community based on Responsibility and Trust

31 international automotive OEM are AUTOSAR partners in constantly growing community. 21 are under the 22 top-selling OEM and covering over 80% of the total market revenue in 2019*.

ISUZU

Tesla

AUTOSAR Mission

AUTOSAR is a global partnership of leading companies in the automotive and software industry to develop and establish the **standardized software framework** and **open E/E system architecture** for intelligent mobility.

"If a company develops alone it will be one proprietary solution, if it is shared and used by several partners it becomes technology, and with broad standardization it becomes state of the art and alleviates certification."

Günter Reichart, AUTOSAR Spokesperson

Big Picture

(main players only)

ADAS Development Cycle

Each organization must find its role, position and interfaces in this development cycle.

Automotive Development Ecosystem (1/2)

Trusted Collaboration on Software Defined Vehicle*

AUTOSAR

Objective: Develop and establish standardized SW framework and open E/E system architecture for intelligent mobility

ASAM

Objective: Open Standards from Pegasus, Service Oriented Vehicle Dlagnostics

Khronos

Objective: open standards for 3D graphics, Virtual and Augmented Reality, Parallel Computing, Machine Learning, and Vision Processing

SOAFEE

Objective: Cloud-native architecture enhanced for mixed-criticality automotive applications; building on technologies which define standard boot and security requirements for Arm architecture

Eclipse SDV

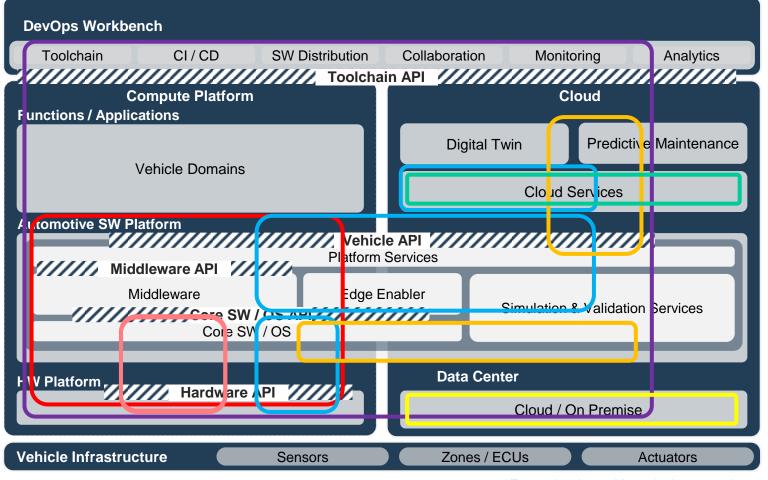

Objective: Open technology platform for the SW defined vehicle of the future; focused on accelerating innovation of automotive-grade in-car software stacks using open source and open specifications

Gaia-X, Catena-X

Goal: Gaia-X European data infrastructure for Hyperscaler Catena-X tracability in supply chain

Cloud Native Computing Foundation (CNCF)

Objective: CNCF is the open source, vendor-neutral hub of cloud native computing, hosting projects like Kubernetes and Prometheus to make cloud native universal and sustainable.

COVESA All Members Meeting 2023

Automotive Development Ecosystem (2/2)

Trusted Collaboration on Software Defined Vehicle*

COVESA (former GENIVI)

Objective: Connected vehicle systems including in-vehicle, atedge and in-cloud services, interfaces and data exchange. Extension of W3C Common Vehicle Interface Initiative (CVII)

AUTOSAR & COVESA Collaboration

Objective:

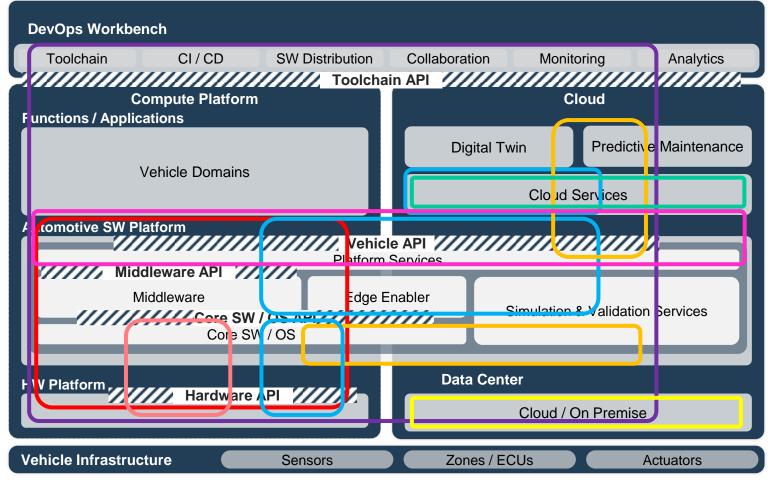

Exchange of vehicle data, described by COVESA's Vehicle Signal Specification (VSS), between the cloud and AUTOSAR's platforms for in-vehicle communication.

- COVESA will focus on vehicle data and services as well as cloud interaction
- AUTOSAR will offer an open interface for the overall system architecture and the in-vehicle network

The collaboration will start with a **Vehicle API** concept being discussed by both organizations.

A joint proof of concept demonstration showing

- a seamless integration of communication
- exchange of data
- access of services between cloud and in-vehicle ECUs.

*Example view without being complete

Outputs – Intended Specifications

Component/Topic	Details/Expectations
Vehicle API Core Specification	A document specifying a transport agnostic API, level of detail similar to VISS Core spec. Expected to be more lightweight than VISS.
Vehicle API Transport Specification MQTT	A document specifying how to use Vehicle API using MQTT. The level of detail similar to VISS Transport spec.
Network adapter interface of the External Connection Handler, including its behavior	A document specifying the interface for the network adapter(s) and how the ECH is managing the adapters.
Vehicle API Data Mapper and VSS Binding Configuration Specification	A document specifying behavior of the data mapper and configuration contents

9

Outputs – Intended Implementations

Component/Topic	Details/Expectations
Linux VSS Application and Vehicle API Client/Binder Reference Implementation	Necessary components for Linux to be able to communicate read/write/subscribe requests towards AUTOSAR using the Vehicle API MQTT transport layer
ECH MQTT Network Adapter	To be used by Vehicle API MQTT client (ref. above)
AUTOSAR External Connection Handler (ECH) Reference Implementation	Full support of Vehicle API
Vehicle API mapping tool chain Reference Implementation	Results in the generation of Data Mapper based on configuration that describes the mapping between selected VSS signals and selected real/simulated sensors/actuators.
Simulator/Emulator	A component that can be installed in Linux and simulates the Vehicle API Southbound interface for the selected transport protocol.

AUTOSAR Opening Strategy

Compatibility & Interoperability – State of Planning

Recent decisions in AUTOSAR supporting the collaboration:

- AUTOSAR can start new development in dedicated open projects governed by Open Source best practices like:
 - Open project charter document
 - Open project specific licenses (e.g MPL v. 2 and Creative Commons CC-BY-SA 4.0
 - state of the art CLA enables AUTOSAR Partners, COVESA Partners and non AUTOSAR and COVESA Partners to contribute
- New membership "Associate Partner Light" decided that is a membership with no partnership fee and allows exploitation of specific AUTOSAR specification only
 - Main purpose is to make the bus protocols more accessible
 - Further IP could be made available based on AUTOSAR decisions in this contract framework

Working Model Draft

3rd Parties may contribute/Adopt

AUTOSAR Members provide Knowledge about the released AUTOSAR IP **AUTOSAR** facilitated

COVESA Members bring in VSS Knowledge

AUTOSAR (Work)

- AUTOSAR evaluates the necessary IP for a Vehicle API internally (Only AUTOSAR Partners)
- AUTOSAR defines how the necessary Interface IP can be made available (e.g. Associate Partner Light or other)
- AUTOSAR promotes the result of the cooperation with a joint COVESA-AUTOSAR branding
- AUTOSAR Partners realizes reference implementation which include Real-Life AUTOSAR (V)RTE based solutions

AUTOSAR/COVESA Vehicle API Project

- Open to everybody and governed by open source principles
- The WG develops based on open IP the specification for a Vehicle API
- The WG develops reference Implementations for the Vehicle API Gateway and example Application.

AUTOSAR Partners feed back, cases where additional IP might be necessary COVESA Members feed back necessary Modifications to the VSS specification

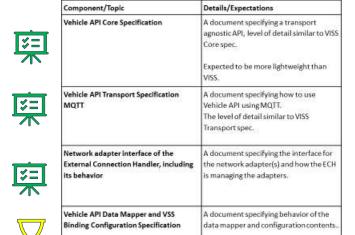

COVESA

- COVESA handles Updates to the VSS specification necessary for the Vehicle API
- COVESA promotes the result of the cooperation with a joint COVESA-AUTOSAR branding
- COVESA develops reference implementations.

Intended Outputs overview(draft assessment)

Outputs – Intended Specifications

COVESA All Members Meeting 2023

Component/Topic	Details/Expectations
Linux VSS Application and Vehicle API Client/Binder Reference Implementation	Necessary components for Linux to be able to communicate read/write/subscribe requests towards AUTOSAR using the Vehicle API MOTT transport layer
ECH MQTT Network Adapter	To be used by Vehicle API MQTT client (ref. above)
AUTOSAR External Connection Handler (ECH) Reference Implementation	Full support of Vehicle API
Vehicle API mapping tool chain Reference Implementation	Results in the generation of Data Mapper based on configuration that describes the mapping between selected VSS signals and selected real/simulated sensors/actuators.
Simulator/Emulator	A component that can be installed in Linux and simulates the Vehicle API Southbound interface for the selected transport protocol.

Work on Output can be started in Open Project

COVESA All Members Meeting 2023

25/04/2023

Work on Output needs further legal clarification in AUTOSAR

The COVESA/AUTOSAR Collaboration

- ✓ All legal prerequisites are defined for starting a joint Open Project on Vehicle API
- ✓ Strong strategic interest from both organizations to collaborate

Next Steps:

- Legal documents have to be finalized and signed
- Update the Charter Document for the joint Open Project Vehicle API
- > Jointly work on the intended Output
