Software Defined Vehicle Telemetry Project - Birds of a Feather Launched

On Monday, Feb 28, 2022, the COVESA Software Defined Vehicle Telemetry Project - Birds of a Feather group was launched. The goal is to enable new experiences and operational use cases with today's connected vehicle systems through digital feedback loops.

The plan is to meet bi-weekly starting on March 14, 2022 to identify and define high value use cases and potential solutions using existing components and assets (e.g. telemetry data sources, open source software, standards, architectures...). The objective is to complement, not compete with other industry initiatives. At the COVESA All Member Meeting on April 27, we will meet face to face for in-depth discussions, presentations, and planning.

Please see the SDV Telemetry Project page for details including: presentations, meeting times and meeting notes. Please spread the word about, join and contribute to the meetings.
